- 2) To understand standard error propagation

INTRODUCTION:

In your laboratory work in this physics course you will observe that when you make repeated measurements of a physical quantity the measurements do not exactly agree. These slight physical variations are made insignificant in the following systematic manner: the measured value is considered to be the arithmetic mean value of N for some value. An important thing (before the analysis) is that you should not be worried about how to do it in the experiment (the measurements). Consequently, instead of a single analysis, the analysis has to be repeated.

Reasons of errors and uncertainties:

There are two general categories of errors: systematic and random.

Systematic errors: are the errors due to some causes. The following diagram may be taken as an example to a cause that is not systematic. It may be due to a systematic error because of being systematic as shown in the diagram. It is due to an error. It is due to a systematic error. It is a problem of error. It is due to a systematic error. It is a problem of error. It is a problem of error. It is a problem of error.

Random errors: are errors which are caused by some causes. They are called random errors. They are called random errors. They are called random errors. They are called random errors. They are called random errors. They are called random errors. They are called random errors. They are called random errors.

In your work in this physics course you will observe that all the measurements have some uncertainty. This is due to the fact that the measurements are not perfect. They are not perfect. They are not perfect. They are not perfect. They are not perfect. They are not perfect. They are not perfect. They are not perfect.

Accuracy versus Precision

In physics, accuracy and precision are two different concepts. Accuracy is the closeness of the measured value to the true value. Precision is the closeness of the measured value to the measured value.

Accuracy and precision are two different concepts. They are not the same. They are not the same. They are not the same. They are not the same. They are not the same. They are not the same. They are not the same. They are not the same.

$$\text{Accuracy} = \frac{\text{measured value} - \text{true value}}{\text{measured value}}$$

Precision is the closeness of the measured value to the measured value. It is the closeness of the measured value to the measured value.
