

The Society of Thoracic Surgeons Practice Guideline on the Prophylaxis and Management of Atrial Fibrillation Associated With General Thoracic Surgery: Executive Summary

Steven C. Fernandez, MD, Michael T. Jaklitsch, MD, Garrett L. Walsh, MD, James E. Tashiro, PhD, Charles D. Rodriguez, MD, PhD, John D. Mitchell, MD, and Joseph B. Sturgeon, MD

Department of Cardiothoracic Surgery, Boston's Veterans Affairs Medical Center, Boston, Massachusetts; Division of Thoracic Surgery, Harvard Medical School, Brigham and Women's Hospital, Boston, Massachusetts; Department of Thoracic and Cardiothoracic Surgery, University of Texas MD Anderson Cancer Center, Houston, Texas; Department of Thoracic and Cardiothoracic Surgery, Harborview Medical Center, University of Washington, Seattle, Washington; Division of Thoracic Surgery, University of Michigan, Ann Arbor, Michigan; Department of Thoracic Surgery, University of Colorado, Aurora, Colorado; Department of Thoracic Surgery, Department of Cardiothoracic Surgery, University of Wisconsin, Madison, Wisconsin; and the VA Medical Center, Durham, North Carolina

Atrial fibrillation (AF) occurs in between 15% and 45% of patients after pulmonary and esophageal surgery. The occurrence is associated with increased postoperative complications, increased length of stay, and increased mortality [1, 2]. Although treatment of AF has been shown within or preoperatively [3], specific recommendations for the prophylaxis and treatment of AF related to general thoracic surgery (GTS) do not exist. Therefore, the Society of Thoracic Surgeons (STS) conducted an Evidence-Based Surgery Review Committee to derive practice recommendations about this situation.

What follows is an executive summary of the full guideline available at <http://www.sts.org/resources/pulmonaryandcardiothoracic/thoracicsurgery/guidelines>. The full guideline includes the complete introduction and detailed sections that fully supports the recommendations listed here.

Methods

Guideline members reviewed all identifiable published English-related to the prophylaxis and management of AF

The members of the Evidence-Based Surgery Review Committee are required to avoid physician bias after double-blind review of data or studies selected for abstracting using standard, accepted criteria for the abstracting, management, or prevention of specific diseases or conditions. While guideline review and development involves a lot of group discussion and debate, guideline authors should avoid individually identifying themselves as the author. Members have guidelines and abstracts assigned and may submit notes. The abstract manager manages the use of a structured abstract review form to the process on behalf of the guideline development group and its review.

after 1990 as well as selected reports related to medical AF and AF after cardiac and general surgical procedures. Publications for review were selected by guideline review committees in three areas: (1) prophylaxis, (2) treatment, and (3) postoperative. Levels of evidence were assigned to each publication, and recommendations were drafted regarding each intervention using the American College of Cardiology/American Heart Association guideline methodology. The document was reviewed and approved according to the STS Approval Process for Practice Guidelines.

Evidence-based guidelines must not be viewed as strict rules. Guidelines are intended to assist health care providers in decision-making by providing a range of acceptable approaches for the management of specific conditions. The ultimate judgment regarding care of a particular patient under specific circumstances must be made by the provider. There are certainly circumstances in which management that falls outside of these guidelines will be appropriate.

History and Risk Factors

Risk factors for postoperative AF include male sex, increasing age, magnitude of lung resection, magnitude of esophageal resection, history of preoperative heart failure, comorbid lung disease, preoperative episodes of all lengths of preoperative AF, and procedures associated with postoperative inflammation, especially dissection around the aorta [4, 5]. Reproductive, low highest rates of preoperative AF occur after pneumonectomy, esophageal or pneumonectomy, and adult lung transplant [6, 7, 8]. After coronary bypass, however, surgical procedures, the incidence of AF has been as low as 14% [9]. In one study, 4 of 100 disseminated, idiopathic patients (4%) had not AF [10]. Atrial fibrillation can also develop postoperatively secondary to a wide variety of stimuli
