Engine control system D12A

This manual has largely been built up in tabular form, the tables having been divided into fault and info codes, electrical and mechanical fault tracing.

When one or more fault codes occur, its or their importance can be read off from the fault code tables. The fault code tables give reference to electrical and/or mechanical fault tracing which is listed later in the manual as the heading of fault tracing procedures. A complete list of electrical fault tracing procedures is shown on page 36.

Note: It is extremely unusual to have faults in the control unit, this implying that **all other** possible faults must be eradicated before the control unit is replaced.

The D12 power unit has an engine control system consisting of a control unit, six electronic unit injectors (one per cylinder) and a number of sensors and contacts which send information to the control unit.

The basic purpose of the control system is to determine the injection angle and fuel quantities required by the engine. Electrical impulses from sensors and contacts are processed by the control unit to calculate injection angles and fuel quantities, this information then being used to control the unit injectors electrically.

The control system has a built-in diagnostic system which makes it possible to discover and trace possible faults.

The control system also directs a number of functions related to fuel monitoring, for example the cruise control and speed limiting functions.
