Objective

- Configure a router to use network address translation (NAT) to convert internal IP addresses, typically private addresses, into outside public addresses.

Background/Preparation

An ISP has allocated a company the public classless interdomain routing (CIDR) IP address 199.99.9.32/27. This is equivalent to 30 public IP addresses. Since the company has an internal requirement for more than 30 addresses, the IT manager has decided to implement NAT. The addresses 199.99.9.33 – 199.99.9.39 for static allocation and 199.99.9.40 – 199.99.9.62 for dynamic allocation. Routing will be done between the ISP and the gateway router used by the company. A static route will be used between the ISP and gateway router and a default route will be used between the gateway router and the ISP. The ISP connection to the Internet will be represented by a loopback address on the ISP router.

Cable a network similar to the one in the diagram above. Any router that meets the interface requirements displayed on the above diagram may be used. This includes the following and any of their possible combinations:

- 800 series routers
- 1600 series routers
