This is review from the SL Physics Material

Vocabulary: current, electric field, electromagnetic induction, magnetic field, magnetic flux, right-hand rule, vector, voltage, wind generator

Prior Knowledge Question (Do this BEFORE using the Gizmo.)

A **wind generator**, such as the one shown at left, uses the power of wind to generate electricity. What do you think is happening inside the wind generator to convert the energy of the spinning blades into electricity? Make your best guess.

The generator contains a device with a strong permanent magnet and a spinning loop of wire, moved by the blades which induces an electric current in the wire.

Usually when you experiment with circuits, you use a battery or another energy source to create a current. But is it possible to generate a **current** without a battery? You can find out with the *Electromagnetic Induction* Gizmo™.

In the Gizmo, you can drag the wire loop around or use the controls to move the magnet up and down. You can also rotate the wire loop. Experiment with the Gizmo to see how many different ways you can create a current in the wire loop and light the light bulb. Describe your findings below.

Moving the wire quickly from side to side, moving the magnet or loop up or down, and spinning the loop near the magnet all cause the light to activate.
