Association Mapping in Plants Nnadozie C. Oraguzie, Erik H.A. Rikkerink, Susan E. Gardiner, H. Nihal de Silva, 2007-01-06

For the past decade there has been success in using conventional map based strategies in identification and cloning of quantitative trait loci QTL in model plant species including tomato and Arabidopsis These quantitative traits are generally the products of many loci with varying degrees of effect upon the observed phenotypes Recently a new approach to genetic mapping has emerged called association mapping This new technique takes into account the thousands of genes to evaluate for QTL effect and is a more efficient approach that does not require generation of segregating populations large numbers of progeny As it can utilize all of the historic recombination events in a diverse population of individuals it can generate higher resolution genetic maps and is needed to complement current map based cloning methods Association Mapping in Plants provides both basic and advanced understanding of association mapping and an awareness of population genomics tools to facilitate mapping and identification of the underlying causes of quantitative trait variation in plants It acts as a useful review of the marker technology the statistical methodology and the progress to date It also offers guides to the use of single nucleotide polymorphisms SNPs in association studies
